

iNet and iNet Pro Feature List

iNet:

iNet is the little brother of iNet Pro. It uses the same advanced scan engine as the Pro version. iNet is for people who just want to know what is going on in their network:

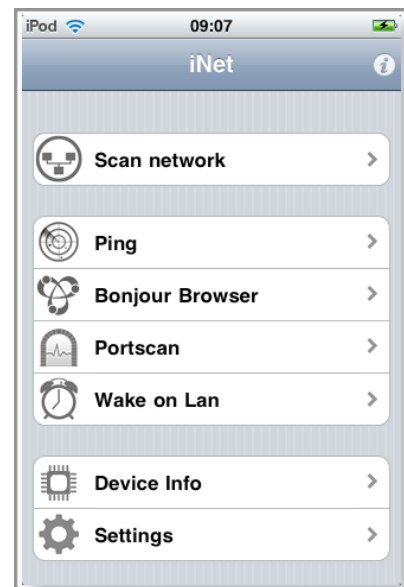

- Scan a network and scan some standard ports. Get an overview what or who is connected to your local network, see running services.
- Update to iNet Pro. Your payment for iNet will be automatically subtracted; you just pay the difference.

iNet Pro

In addition to perform the basic network scan the Pro version of iNet gives you these features (and more to come) - all in one App:

- Ping to find out if a device is running and reachable.
- Find out which Bonjour-Services are running on your devices.
- Scan for open ports to see if there are vulnerabilities (are ports open that should not be opened). Scan ports, port-lists and port ranges.
- Wake up devices locally or via internet; set Macintosh computers to sleep or shutdown remotely.
- Get info about your internal and external IP's and more.
- Extensive Help section

iNet Pro gets updates and new features on a regular cycle - at no additional cost.
